

Automation Fit

Automation is recommended when work is repetitive, rules are clear, data quality is sufficient, and the client can define success criteria. This page is part of the Code 5 Developers knowledge library and supports software development, systems development, maintenance, and technology operations.

AI Use

AI features must include human review where outcomes affect clients, payments, legal obligations, security, or sensitive decisions. This page is part of the Code 5 Developers knowledge library and supports software development, systems development, maintenance, and technology operations.

Integration Safety

Integrations must handle retries, idempotency, rate limits, partial failure, monitoring, and reconciliation. This page is part of the Code 5 Developers knowledge library and supports software development, systems development, maintenance, and technology operations.

Data Boundaries

AI and automation systems must respect client data boundaries and avoid sending sensitive data to unapproved providers. This page is part of the Code 5 Developers knowledge library and supports software development, systems development, maintenance, and technology operations.

Evaluation

Automation and AI work should be evaluated for accuracy, latency, failure rate, user acceptance, and operational cost. This page is part of the Code 5 Developers knowledge library and supports software development, systems development, maintenance, and technology operations.

Operational note: use the documented process, keep client decisions visible, protect client data, and escalate delivery, security, or production risks before they become client-impacting issues.

Operational note: use the documented process, keep client decisions visible, protect client data, and escalate delivery, security, or production risks before they become client-impacting issues.

Operational note: use the documented process, keep client decisions visible, protect client data, and escalate delivery, security, or production risks before they become client-impacting issues.

Operational note: use the documented process, keep client decisions visible, protect client data, and escalate delivery, security, or production risks before they become client-impacting issues.
